Acknowledgements

Everyone involved in this project would like to extend many thanks to the principals and superintendents who chose to participate in the 2009 MIYHS, and to the teachers and school staff who supported the effort. Most importantly, we would like to thank the students who took the time and effort to share their experiences with us. This report is our way of thanking all of you. We hope you find the information contained in this report insightful and useful.

The development and implementation of the 2009 Maine Integrated Youth Health Survey (MIYHS) was a collaborative effort between the Maine Department of Education and the Maine Department of Health and Human Services. Pan Atlantic SMS Group of Portland, Maine administered the 2009 MIYHS and compiled the results. Technical services (including sampling, weighting, and automated report generation) were provided by Westat, a research organization based in Rockville, MD.

SECTION 1: METHODOLOGY

MIYHS Methodology

The following is a brief description of the methodology employed for the High School (HS) survey of the 2009 MIYHS. A full methodological description, including a description of all four surveys (K/3, 5/6, MS, and HS) was produced separately, and can be found at: www.maine.gov/tools/whatsnew/attach.php?id=101800&an=1.

A. Sampling

The sampling frames for the 2009 MIYHS consisted of all Maine public schools and quasi-public schools (private schools with at least 60% publicly funded students) with students in any grades nine through twelve (HS). The sampling frame was obtained from the Maine Department of Education with enrollment as of August 1, 2008. The MIYHS sample was a two-stage cluster design to produce a representative sample of public school and quasi-public school students in the above populations in Maine.

In the first sampling stage, all schools in Maine with any grades nine through twelve were invited to participate. In the second sampling stage, all students in the school were asked to participate in the survey, but, in order to obtain the data needed by all stakeholders and still limit the length of the survey form, as requested by schools and as required by the Youth Risk Behavior Survey (YRBS), classes were randomly assigned to take one of four survey modules (A, B, C, or D).

The sampling software, PCSample developed for the YRBS was used for selecting the MIYHS samples. PCSample selects representative samples of schools and classes within selected schools. The sample is designed so that every eligible student has an equal chance of selection.

In the first sampling stage, all schools with grades in the HS population (grades 9 through 12) were invited to participate. As of August 1, 2008, there were 134 schools listed by the Maine DOE as having any grades 9 through 12. After sampling, three (3) schools were deemed to be ineligible because the school was considered a “special purpose school” that did not serve the general public school population; thus there were 131 schools in the HS frame. The schools listed in the sampling frame were randomly split into two groups, with Group 1 containing 65 schools and Group 2 containing 66 schools. For Group 1, classes within each school were randomly assigned to either Module A or Module C. Similarly, within a school in Group 2, classes were randomly assigned to either Module B or Module D. Students in the same class completed the same module of the survey. One hundred eight (108) of the 131 schools in the final sample participated in the survey for a school response rate of 82.4%; all 51,121 students in grades 9 through 12 in these schools were invited to take part in the survey. In Group 1, 51

MIYHS Methodology

of the 65 schools in the frame participated in the survey for a school response rate of 78.5%. In Group 2, 57 of the 66 schools in the frame participated in the survey for a school response rate of 86.4%.

B. Survey Questions

The questions for the HS survey of the 2009 MIYHS can be found in the Appendix. Questions were selected from the Youth Risk Behavior Survey, the Maine Youth Drug and Alcohol Use Survey, the Maine Youth Tobacco Survey, and input from programs at the Maine CDC, including the Oral Health, Diabetes and Asthma Programs.

C. Participation

Passive consent was used for the HS survey in the 2009 MIYHS. To obtain passive consent, participating schools were required to send an informational letter to parents via the U.S. mail. Principals were informed that the parent letters were translated into several languages (Acoli, Arabic, Chinese, French, Somali, Spanish, and Vietnamese) and would be made available upon request. The letter explained that the survey was anonymous, participation was voluntary, and results would only be presented in group-summary form. The letter informed parents that a copy of the survey instrument was on file at their child's schools if they wished to review it, and that translations were available. Parents who wished to decline their child's participation were asked to notify the school. Schools were told not to survey any student whose parent letter was returned undeliverable. Principals were asked to complete and return a form confirming the mailing of the parent letters. Students whose parents did not give them permission to participate in the survey and/or did not themselves wish to participate in the survey were asked to sit quietly at their desks with an alternate activity during survey administration.

A total of 40,329 of the 51,121 enrolled students in the participating schools on the HS level took the survey for a student response rate of 78.9%. The overall response rate (school response rate multiplied by student response rate) was 65.0%.

MIYHS Methodology

Response rates for the HS survey are listed in the tables below:

D. Weighting

The MIYHS data were weighted (1) to reflect selection probabilities; (2) to reduce any bias in the estimates due to non-response on the part of the schools and/or the students; and (3) to produce estimates that can be generalized to the full population. It was determined that data would be weighted if the overall response rate of a survey was at least 50%. Low response rates can result in a sample that is not a representative subset of the population; in these cases, weighting cannot adequately adjust to create representative data. **The data for Knox County at the high school level were unweighted due to low response rates.** Please note that the unweighted results from these samples may only reflect the health behaviors of students who actually took the survey.

Student analysis weights were computed to facilitate analyses at the state-, county-, public health district-, and school-levels. Two sets of student analysis weights were computed for the HS survey. One set of weights was computed for analyzing school-level data; another set for analyzing county-, public health district, and state-level data. For school-level data, the weights were not post-stratified, and therefore, unweighted and weighted rates are equal in all cases. The set of weights for county, public health district and state-level analyses was first constructed by county. The sum of the weights for a county represents the target student population in the county, taking student non-response, grade and gender into consideration. To obtain the target student population in the public health district, the weights were aggregated in the counties that comprised the public health district. Similarly, to obtain the target student population in Maine, the weights were aggregated for all the public health districts.

For the HS sample, a county/public health district/state-level weight was computed for each of the following survey modules: Module A, Module B, Module C, Module D, Modules A and B combined, Modules C and D combined, and all four modules combined.

The student analysis weight was the product of the inverse of the selection probability of the school, the inverse of the selection probability of the student, the school non-response adjustment factor, the student non-response adjustment factor, and the post-stratification factor. For the school-level analysis weight, both the selection probability of the school and the school non-response adjustment are equal to one. Each of the weighting steps for the HS survey and the school-level analysis weights are described in the full methodological report, which can be found at: www.maine.gov/tools/whatsnew/attach.php?id=101800&an=1.

E. Answers of Interest

While many questions on the MIYHS offered a range of answers, all data reported in this report are based on a predetermined “answer of interest.” One or more of the possible answers were selected for the reporting in this report. In some cases, certain answers (including missing answers) were eliminated from the calculation. For more detail, please see the Appendix for these calculations. The percentages listed in the data are the percentage of students that answered in the way specified in the question title; for instance, among those with asthma, 29.7% of Maine’s HS students have had an episode of asthma or an asthma attack in the past year.

F. Confidentiality

Precautions were taken to protect the anonymity of all students participating in the MIYHS. The MIYHS does not ask for the students' names or birthdays, and reporting by racial or ethnic group is strictly limited; responses for subsets of data with underlying populations of fewer than 5,000 people were suppressed in reports when there were fewer than six (6) individuals in any given response category. Reports are not released for grades, schools or SAUs with fewer than 20 participating students. For further information regarding the steps that were taken to ensure confidentiality and anonymity, please see the full methodological report at: www.maine.gov/tools/whatsnew/attach.php?id=101800&an=1.

G. Limitations

The MIYHS is limited due to its exclusive focus on youth *in school*. With such a focus, some subpopulations – such as school dropouts, students with high rates of absenteeism, home-schooled students, homeless youth, and runaway youth – will be missed or underrepresented. Also of note, some schools with very small enrollments (such as those found on Maine's islands and/or in very rural areas) may be underrepresented due to enrollment-based sampling exclusions.

Because of the anonymous nature of the questionnaire and the difficulty in translating questions into multiple languages, students with very limited English language proficiency may be underrepresented. In addition, to maintain both confidentiality and consistency in the interpretation of questions, teachers were instructed to not provide additional explanation of questions, so students with reading abilities below that of the survey or with cognitive disabilities may have not completed the survey and, therefore, may be underrepresented as well.

Self-reported data may be prone to bias due to forgetting, deception, or misunderstanding of the questions, all of which can contribute to under- or over-reporting of some behaviors. However, several studies have shown that surveys of adolescents yield valid and reliable data¹.

H. Note on YRBS and MIYHS Results

The intent of MIYHS was to follow the YRBS methodology so that results would be comparable to national data and to Maine YRBS data (presented by the US CDC). However, the weighting procedures of the YRBS and MIYHS are not directly comparable, and thus not all MIYHS results are the same as the data for Version C (Maine's YRBS), which was sent to the US CDC for use in YRBS. MIYHS weighting uses county-level weights in addition to school-response, student response and post-stratification to calculate state-level weights. The YRBS, which samples at the state level only, does not use county weights when calculating the state-level weights. Unlike the 2009 MIYHS, the US CDC post-stratifies by race and Hispanic ethnicity. It is unlikely that the lack of racial and ethnic post-stratification was a major influence on the state-wide results, given the low percentages of non-white students in Maine.

Recommendations on when to use MIYHS results and when to use YRBS results:

- When making comparisons with national rates or rates in other states, use YRBS (as reported on the US CDC website: www.cdc.gov/healthyyouth/yrbs).
- When making comparisons between the state rate and county rates, use MIYHS.

Further analysis of differences in MIYHS and previous YRBS and MYDAUS results are underway.
